ABSTRACT
In this paper, we first define the new notion of fuzzy uniform normal structure. Moreover, we prove that the spectrum of the category of fuzzy reflexive spaces is broader than the category of the spaces which have fuzzy normal structure. Also, we introduce the notions of FNST, FNSTN and we prove the theorems of the fixed points of some classes of mappings on the sets from the fuzzy reflexive space, which have some of the properties FNST, FNSTN.

Key Words: Fixed point, Fuzzy norm, Fuzzy normed spaces, Fuzzy reflexive spaces.

1. INTRODUCTION
Baillon and Schoneberg [6] showed that the space X have the Browder-Kirk-Gohde (BKG) property if any nonexpansive self-mapping of a nonempty closed convex and bounded subset E of X have a fixed point in E. Also, Browder and Gohde, independently, showed that uniformly convex Banach spaces have the property BKG. We know for some of the mappings on fuzzy Banach spaces that have the fuzzy normal structure, there are many results about the existence of the fixed point. W. A. Kirk showed that a class of Banach spaces, namely, reflexive Banach spaces with normal structure, have the property BKG or every reflexive Banach space with asymptotic normal structure has the property BKG and proved that if K is a subset of reflexive Banach space with normal structure, the nonexpansive mapping T: K → K has a fixed point. The existence of the fixed point for one class of mappings on the sets which have the normal structure is considered in the paper [17]. Now we introduce the conditions FNST and FNSTN for subsets on the fuzzy reflexive spaces which extend the fuzzy normal structure and we obtain some new results in fixed point theory.

2. PRELIMINARIES
Let η be a fuzzy subset on ℝ, i.e. a mapping η: ℝ → [0, 1] with grade of membership η (t), for each real number t.

*Corresponding author, e-mail: bdaraby@maragheh.ac.ir
In this paper we consider the concept of fuzzy real numbers (fuzzy intervals) in the sense of Xiao and Zhu which is defined below:

**Definition 2.1.** [18] A fuzzy subset $\eta$ on $\mathbb{R}$ is called a fuzzy real number (fuzzy intervals), whose $\alpha$-level set is denoted by $[\eta]_\alpha$, i.e., $[\eta]_\alpha = \{ t : \eta(t) \geq \alpha \}$, if it satisfies two axioms:

$(N_1)$ There exists $r \in \mathbb{R}$ such that $\eta(r) = 1$.

$(N_2)$ For all $0 < \alpha \leq 1$, there exists real number $\eta^* \in (\infty, \infty)$ such that $[\eta]_\alpha$ is equal to the closed interval $[\eta^*_\alpha, \eta^*_\alpha]$.

The set of all fuzzy real numbers (fuzzy intervals) is denoted by $F(\mathbb{R})$. If $\eta \in F(\mathbb{R})$ and $\eta(t) = 0$ whenever $t < 0$, then $\eta$ is called a non-negative fuzzy real number and $F^+(\mathbb{R})$ denotes the set of all non-negative fuzzy real numbers. Real number $\eta^*_\alpha \geq 0$ for all $\eta \in F^+(\mathbb{R})$ and each $\alpha \in (0,1]$. The number $\tilde{0}$ stands for the fuzzy real number as:

$$\tilde{0}(t) = \begin{cases} 1 & t = 0 \\ 0 & t \neq 0 \end{cases}$$

It is clear that $\tilde{0} \in F^+(\mathbb{R})$.

Fuzzy real number $\tilde{r} \in F(\mathbb{R})$ defined by

$$F^n(t) = \begin{cases} 1 & t = r \\ 0 & t \neq r \end{cases}$$

it follows that $\mathbb{R}$ can be embedded in $F(\mathbb{R})$, that is if $r \in (\mathbb{R}, \mathbb{R})$, then $\tilde{r} \in F(\mathbb{R})$ satisfies $\tilde{r}(t) = \tilde{0}(t - r)$.

**Definition 2.2.** [9] Let $\delta, \gamma \in F(\mathbb{R})$ and $[\delta]_\alpha = [\delta^*_\alpha, \delta^*_\alpha], [\gamma]_\alpha = [\gamma^*_\alpha, \gamma^*_\alpha]$ for each $\alpha \in (0,1]$. Define a partial ordering by $\delta \leq \gamma$ in $F(\mathbb{R})$ if and only if $\delta^*_\alpha \leq \gamma^*_\alpha$ and $\delta^*_\alpha \leq \gamma^*_\alpha$ for each $\alpha \in (0,1]$. The strict inequality in $F(\mathbb{R})$ is defined by $\delta < \gamma$ if and only if $\delta^*_\alpha < \gamma^*_\alpha$ and $\delta^*_\alpha < \gamma^*_\alpha$ for each $\alpha \in (0,1]$. Let $\eta \in F(\mathbb{R})$. Then $\eta > \tilde{0}$ if and only if $\eta \not\leq \tilde{0}$.

**Proof.** The proof follows immediately from Definition 2.2.

According to Mizumoto and Tanaka [13], fuzzy arithmetic operations $\oplus, \odot, \ominus$ and $\otimes$ on $F(\mathbb{R}) \times F(\mathbb{R})$ can be defined as:

$$(\eta \oplus \delta)(t) = \nu_{(\eta \oplus \delta)}(\min(\eta(x), \delta(y)))$$

$$= \sup_{\epsilon \in \mathbb{R}}(\eta(x \ominus \epsilon) \wedge \delta(t - \epsilon)), t \in \mathbb{R}$$

$$(\eta \odot \delta)(t) = \nu_{(\eta \odot \delta)}(\min(\eta(x), \delta(y)))$$

$$= \sup_{\epsilon \in \mathbb{R}}(\eta(x) \wedge \delta(t - \epsilon)), t \in \mathbb{R}$$

$$= \sup_{\epsilon \in \mathbb{R}}(\eta(st) \wedge \delta(s(t))), t \in \mathbb{R}$$
Definition 2.9. [18] Let (X, || . ||) be a fuzzy normed linear space.

(i) A sequence \( \{x_n\} \subset X \) is said to converge to \( x \in X \) \( (\lim_{n \to \infty} x_n = x) \), if \( \lim_{n \to \infty} ||x_n - x||_\alpha = 0 \), \( \forall \alpha \in (0, 1] \).

(ii) A sequence \( \{x_n\} \subset X \) is said Cauchy, if \( \lim_{m \to \infty} \lim_{n \to \infty} ||x_n - x_m||_\alpha = 0 \), \( \forall \alpha \in (0, 1] \).

Definition 2.10. [18] Let (X, || . ||) be a fuzzy normed linear space. A subset \( \Omega \) of X is said to be complete, if every Cauchy sequence in \( \Omega \) converges in \( \Omega \). The fuzzy normed space \((X, || . ||)\) is said to be a fuzzy Banach space if it is complete.

Definition 2.11.[11] Let \( (X, || . ||) \) be a fuzzy normed linear space and \( \alpha \in (0, 1] \). The space is said to be \( \alpha \)-complete if it is complete w.r.t. \( || . ||_\alpha \) where \( || x ||_{\alpha \alpha} = || x ||_\alpha = || x ||_\alpha \).

Remark 2.12. [11] It is easily followed that if \( X \) is \( \alpha \)-complete then it is also complete w.r.t. \( || . ||_\alpha \).

Definition 2.13. Let \( (X, || . ||) \) be fuzzy normed linear space. A subset \( S \) of \( X \) is said to be fuzzy bounded if there is a fuzzy real number \( \eta \geq 0 \) such that for all \( x \in S \),

\[ || x || \leq \eta. \]

Definition 2.14. [3] Let \( T : X \rightarrow X \) be a mapping where \( (X, || . ||) \) is a fuzzy normed linear space. Then \( T \) is said to be fuzzy nonexpansive if for all \( x, y \in X \),

\[ ||Tx - Ty||_{\alpha} \leq ||x - y||_{\alpha}. \]

Proposition 2.15. [3] Let \( (X, || . ||) \) be a fuzzy normed linear space. A mapping \( T : X \rightarrow X \) is fuzzy nonexpansive iff \( T \) is nonexpansive w.r.t. \( || . ||_\alpha \) and \( || . ||_\alpha \) for all \( \alpha \in (0, 1] \).

Definition 2.16. A set \( C \subset X \) is said to be fuzzy convex if \( \lambda C + (1 - \lambda)C \subset C \) for \( 0 \leq \lambda \leq 1 \).

Notice that Definition 2.16 is subtly different from definition of fuzzy convex set in [14] and is extension of it.

Theorem 2.17. [11] Let \( E \) be a nonempty, weakly compact, convex subset of a Banach space and \( E \) has normal structure. Then every nonexpansive mapping \( T : E \rightarrow E \) has a fixed point.

Remark 2.18. [5] Let \( (X, || . ||) \) be a fuzzy normed linear space. Then \( (X, || . ||_+ \) and \( (X, || . ||_\alpha \) are normed linear spaces for each \( \alpha \in (0, 1] \). We denote by \( (X, || . ||_+ \) and \( (X, || . ||_\alpha \) the first conjugate space of \( (X, || . ||_+ \) and \( (X, || . ||_\alpha \) respectively; also we denote by \( X^{**} \) and \( X^{**\alpha} \) the second conjugate spaces of \( (X, || . ||_+ \) and \( (X, || . ||_\alpha \) respectively.

Remark 2.19. [5] \( \varphi_{X^{**\alpha}}(f) = f(x) \), for all \( f \in X^{**}\alpha \subset X^{**} \). For fixed \( x \in X \), we define for each \( \alpha \in (0, 1] \), a functional \( \varphi_{X^{**\alpha}}(f) = f(x) \), for all \( f \in X^{**}\alpha \).

Remark 2.20. [5] For each \( \alpha \in (0, 1] \), we define a mapping \( J_{\alpha} : X \rightarrow X^{**\alpha} \) by \( J_{\alpha}(x) = \varphi_{X^{**\alpha}} \) for all \( x \in X \) then \( J_{\alpha} \) is isomorphically isometric between the space \( (X, || . ||_\alpha \) and the subspace \( J_{\alpha}(X) \) of \( X^{**\alpha} \) and \( || J_{\alpha} ||_{\alpha} = 1 \), for all \( \alpha \in (0, 1] \).

Remark 2.21. [5] For each \( \alpha \in (0, 1] \), we define a mapping \( J_{\alpha} : X \rightarrow X^{**\alpha} \) by \( J_{\alpha}(x) = \varphi_{X^{**\alpha}} \) for all \( x \in X \) then \( J_{\alpha} \) is isomorphically isometric between the space \( (X, || . ||_\alpha \) and the subspace \( J_{\alpha}(X) \) of \( X^{**\alpha} \) and \( || J_{\alpha} ||_{\alpha} = 1 \), for all \( \alpha \in (0, 1] \).

Definition 2.22. [5] Let \( (X, || . ||) \) be a fuzzy normed linear space. X is said to be left fuzzy reflexive if there exists \( \alpha_1 \in (0, 1] \), such that \( J_{\alpha_1} \) is onto, for all \( \alpha \geq \alpha_1 \), i.e. \( J_{\alpha}(X) = X^{**\alpha} \) for all \( \alpha \geq \alpha_1 \).

Definition 2.23. [5] Let \( (X, || . ||) \) be a fuzzy normed linear space. X is said to be right fuzzy reflexive if there exists \( \alpha_2 \in (0, 1] \), such that \( J_{\alpha_2} \) is onto, for all \( \alpha \leq \alpha_2 \), i.e. \( J_{\alpha}(X) = X^{**\alpha} \) for all \( \alpha \leq \alpha_2 \).

Definition 2.24. [5] Let \( (X, || . ||) \) be a fuzzy normed linear space. X is said to be reflexive if it is both left and right fuzzy reflexive, i.e., there exists \( \beta_1, \beta_2 \in (0, 1] \) such that \( J_{\alpha}(X) = X^{**\alpha} \), for all \( \alpha \geq \beta_1 \), and \( J_{\alpha}(X) = X^{**\alpha} \), for all \( \alpha \leq \beta_2 \).

Since \((X^{**}, || . ||)\) must always be a complete fuzzy normed linear space, no incomplete space can be fuzzy reflexive. However there exists fuzzy irreflexive complete fuzzy normed linear space.

3. EXTENSION OF FUZZY NORMAL STRUCTURE

Definition 3.1. Let \( (X, || . ||) \) be a fuzzy normed linear space. X is said to have fuzzy uniform normal structure if for nonempty convex closed and bounded subset \( C \) of \( X \) there exists \( \tilde{N} < \tilde{T} \) (for \( N < 1 \) ) such that

\[ \text{rad}(C) \cap \text{diam}(C) \leq \tilde{N} \]

i.e.,

\[ \{ \inf \{ \sup \{ y : y \in C, x \in C \} \} \subseteq \sup \{ x, y \in C \} \mid y - x \leq \tilde{N} \} \]

thus since \([\tilde{N}]_\alpha = [N, N] \), for \( \alpha \in (0, 1] \), then

\[ \{ \inf \{ \sup \{ y : y \in C, x \in C \} \mid y - x \leq N \} \} \leq \tilde{N} \]

and

\[ \{ \inf \{ \sup \{ y : y \in C, x \in C \} \mid y - x \leq N \} \} \leq N. \]

Definition 3.2. Let \( (X, || . ||) \) be a fuzzy normed linear space. X is said to have fuzzy normal structure if there exists \( \beta_1, \beta_2 \in (0, 1] \) such that X has fuzzy uniform
normal structure w.r.t. \( \| \cdot \|_u \) for all \( \alpha \geq \beta_1 \) and w.r.t. \( \| \cdot \|_u^* \) for all \( \alpha \leq \beta_2 \).

Now, we show that the spectrum of the category of fuzzy reflexive spaces is broader than the category of the spaces which have fuzzy normal structure.

**Theorem 3.3.** Let \( (X, \| \cdot \|) \) be \( \alpha \)-complete fuzzy normed linear space for each \( \alpha \in (0,1] \). If \( X \) has fuzzy normal structure, then it is fuzzy reflexive.

**Proof.** Since \( (X, \| \cdot \|) \) is \( \alpha \)-complete for each \( \alpha \in (0,1] \), then \( X \) is complete w.r.t. \( \| \cdot \|_u \) and \( \| \cdot \|_u^* \) for each \( \alpha \in (0,1] \). Again \( X \) has fuzzy normal structure, thus by Definition 3.2, it follows that there exists \( \beta_1, \beta_2 \in (0,1] \) such that \( X \) has fuzzy uniform normal structure w.r.t. \( \| \cdot \|_u \) for all \( \alpha \geq \beta_1 \) and w.r.t. \( \| \cdot \|_u^* \) for all \( \alpha \leq \beta_2 \). We know that if a Banach space has normal structure then it is reflexive. Thus \( X \) is reflexive w.r.t. \( \| \cdot \|_u \) for all \( \alpha \geq \beta_1 \) and \( \| \cdot \|_u^* \) for all \( \alpha \leq \beta_2 \). Hence \( X \) is fuzzy reflexive.

**Definition 3.4.** Let \( M \) be a nonempty closed fuzzy convex and fuzzy bounded subset of a fuzzy reflexive \( X \). Suppose \( S \) be any closed and convex subset of \( M \) with more than one element. Let for \( \alpha \in (0,1] \), diam \( (S)=\text{diam}(S)_u \), diam \( (S)_u^* \). For the set \( M \subset X \), we say that it has the property RFNST if there is a mapping \( T:M \rightarrow M \), so that for some \( x_0 \in S \) there is \( \alpha_1 \in (0,1] \), such that for \( \alpha \geq \alpha_1 \),

\[
\sup_{z \in S} \| x_0 - T^{-k}z \|_u < \text{diam}(S)_u
\]

for some \( k \in \mathbb{N} \), \( T^k(S) \subset S \).

**Definition 3.5.** Let’s assume that sets \( M, S \) satisfy conditions of the above definition. For the set \( M \subset X \), we say that it has the property RFNST if there is a mapping \( T:M \rightarrow M \), so that for some \( x_0 \in S \) there is \( \alpha_2 \in (0,1] \), such that for \( \alpha \leq \alpha_2 \),

\[
\sup_{z \in S} \| x_0 - T^{-k}z \|_u^* < \text{diam}(S)_u^*
\]

for some \( k \in \mathbb{N} \), \( T^k(S) \subset S \).

**Definition 3.6.** Let’s assume that sets \( M, S \) be as above. For the set \( M \subset X \) we say that it has the property FNST if it is both RFNST and RNST, i.e., there is a mapping \( T:M \rightarrow M \) so that for some \( x_0 \in S \),

\[
\sup_{z \in S} \| x_0 - T^{-k}z \| < \text{diam}(S)
\]

for some \( k \in \mathbb{N} \), \( T^k(S) \subset S \).

**Definition 3.7.** Let’s assume that sets \( M, S \) be as above. For the set \( M \subset X \) we say that it has the property LFNST if there is a mapping \( T:M \rightarrow M \), so that for some \( x_0 \in S \), there is \( \alpha_1 \in (0,1] \), such that for \( \alpha \geq \alpha_1 \),

\[
\sup_{n \in \mathbb{N}} \| x_0 - T^{nk}x_0 \|_u < \text{diam}(S)_u
\]

and \( Tx_0 \in S \).

**Definition 3.8.** Let’s assume that sets \( M, S \) be as above. For the set \( M \subset X \) we say that it has the property RFNSTN if there is a mapping \( T:M \rightarrow M \), so that for some \( x_0 \in S \), there is \( \alpha_2 \in (0,1] \), such that for \( \alpha \leq \alpha_2 \),

\[
\sup_{n \in \mathbb{N}} \| x_0 - T^{nk}x_0 \| < \text{diam}(S)_u
\]

and \( Tx_0 \in S \).

**Definition 3.9.** Let’s assume that sets \( M, S \) be as above. For the set \( M \subset X \) we say that it has the property FNSTN if it is both LFNSTN and RFNSTN, i.e., if there is a mapping \( T:M \rightarrow M \), so that for some \( x_0 \in S \),

\[
\sup_{n \in \mathbb{N}} \| x_0 - T^{nk}x_0 \| < \text{diam}(S)
\]

and \( Tx_0 \in S \).

4. THE NEW RESULTS

**Definition 4.1.** Let \( (X, \| \cdot \|) \) be a fuzzy normed linear space. The fuzzy bounded set \( K \subset X \) is said to be weakly compact if every open cover of \( K \) has a finite subcover. Let \( E \) be a reflexive fuzzy space, i.e., right and left reflexive. With closed and convex bounded set is weakly compact.

Let us prove the existence of the fixed point for \( T \) that is defined on the sets from fuzzy reflexive space \( X \), with the condition FNST or FNSTN.

**Theorem 4.2.** Let \( K \) be nonempty closed fuzzy convex and fuzzy bounded subset of the fuzzy reflexive space \( X \) and let \( K \) have the property FNST, where \( T \) is one of the mappings which is defined in the property FNST. If for every closed and convex subset \( E \subset K \) it satisfies that \( T(E) \subset K \), \( k \in \mathbb{N} \) and for set \( K \) which has the property FNST is valid that

\[
\| Tx - Ty \| \leq \sup_{z \in \mathbb{E}} \| x - T^k z \|,
\]

then the mapping \( T \) has a fixed point.

**Proof.** Let \( G \) be the set of all nonempty closed and convex subsets \( E \subset K \) for which \( T(E) \subset E \). The set \( G \) is nonempty, because \( K \notin G \). Set inclusion defines a relation of ordering on \( G \). From the fuzzy norming and mapping of the space \( X \), it follows that the space \( X \) is complete, so every chain in \( G \), which is consists of nonempty closed fuzzy convex and fuzzy bounded set of \( G \), by reflexivity of \( X \), has nonempty intersection. By Zorn’s Lemma there is the minimal element \( S \) of the set \( G \).

If \( S \) consists only of one element, on the basis of supposition that \( T(S) \subset S \), this element is also the fixed point of the mapping \( T \).

If \( S \) has more than one point with the property FNST, it satisfies that

\[
\sup_{z \in \mathbb{E}} \| x_0 - T^k z \| < \text{diam}(S),
\]

for certain \( k \in \mathbb{N} \) and \( x_0 \in S \).

If in the inequality (1) we put that \( x = x_0 \), we have that
\[\|Tx_0 - Ty\| \leq \sup_{x \in E} \|x_0 - T^k z\|,\]

so that all \(Ty, y \in S\) are in the ball with the center in \(Tx_0\) and radius \(\sup_{x \in E} \|x_0 - T^k z\| = r\), i.e., \(T(S) \subset B(Tx_0, r)\) and that is also \(T^k(S) \subset B(Tx_0, r)\).

Since \(T(S) \subset S\) it implies that \(T^k(S) \subset \subset B(Tx_0, r)\) and on the basis of minimality of the set \(S\), it satisfy \(B(Tx_0, r) \cap S = S\), so that \(S \subset B(Tx_0, r)\). From the relation \(S \subset B(Tx_0, r)\) it implies that

\[\|Tx_0 - y\| \leq \sup_{x \in E} \|x_0 - T^k z\|, \quad (2)\]

for all \(y \in S\).

Let us form the set

\[S' = \{v \in S : \sup_{x \in E} \|v - z\| \leq \sup_{x \in E} \|x_0 - T^k z\|\}.\]

On the basis of definition of the set \(S'\) and the relation \(2\) we conclude that the set \(S'\) is fuzzy bounded and closed, with regard to \(Tx_0 \in S'\), then \(S'\) also nonempty set.

Let us prove that for all \(v \in S'\) it satisfy that \(Tv \in S'\). Since \(S\) is a nonempty, limited, closed and convex set with more than one element and it is a minimal element of the family \(G\) and is valid that \(TS \subset S\), then is \(S = CoTS\).

If \(z \in S\), then \(z\) can be calculated as convex combination of the elements from \(TS\), i.e.

\[z = \sum_{i=1}^{n} \alpha_i Tz_i, \quad \sum_{i=1}^{n} \alpha_i = 1, \alpha_i \geq 0, z_i \in S.\]

Now

\[\|Tv - z\|_a = \|Tv - \sum_{i=1}^{n} \alpha_i Tz_i\|_a \leq \sum_{i=1}^{n} \alpha_i \|v - T^k z\|_a \leq \sum_{i=1}^{n} \alpha_i \sup_{x \in E} \|v - z\|_a \leq \sup_{x \in E} \|x_0 - T^k z\|_a = \sup_{x \in E} \|x_0 - T^k z\|_a = r,\]

and

\[\|Tv - z\|_a \leq \|Tv - \sum_{i=1}^{n} \alpha_i Tz_i\|_a \leq \sum_{i=1}^{n} \alpha_i \sup_{x \in E} \|v - z\|_a \leq \sum_{i=1}^{n} \alpha_i \sup_{x \in E} \|v - z\|_a = \sup_{x \in E} \|x_0 - T^k z\|_a = r,\]

i.e., we have

\[\|Tv - z\| \leq \sup_{x \in E} \|x_0 - T^k z\|_a,\]

i.e., we have

\[\|Tv - z\| \leq \sup_{x \in E} \|x_0 - T^k z\|_a,\]

so that \(TS' \subset S'\).

Let us give the sequence \(\{a_n\} \subset S'\), for all \(n \in \mathbb{N}\) and let \(a_n \to a \in S\) when \(n \to \infty\). 

Now

\[\sup_{x \in E} \|a - a_n\| \leq \sup_{x \in E} (\|a - a_n\| + \|a_n - z\|) = \|a - a_n\| + \|a_n - z\| \leq \|a - a_n\| + r.\]

When \(n \to \infty\) we get that

\[\sup_{x \in E} \|a - z\| \leq r,\]

then the set \(S'\) is closed.

Let \(v\) and \(u\) be two points from \(S'\). For \(\lambda \in [0, 1]\) we have that

\[\lambda v + (1 - \lambda) u - z \|_a = \lambda v + (1 - \lambda) u - \lambda z + \lambda z - z \|_a \leq \lambda \sup_{x \in E} \|x_0 - T^k z\|_a + (1 - \lambda) \sup_{x \in E} \|x_0 - T^k z\|_a = r,\]

i.e., we have \(\lambda v + (1 - \lambda) u - z \|_a \leq r\), so the set \(S'\) is convex.

Let for \(\alpha \in (0, 1]\), \([\text{diam } (S')]_a = [\text{diam } (S')^\alpha, \text{diam } (S')^\alpha]_a\) and similarly for \(\text{diam } (S)\).

For \(v, w \in S'\) we have that

\[\text{diam } (S') = \sup_{v, w \in S'} \|v - w\| \leq \sup_{v \in S', w \in S} \|v - z\| \leq \sup_{x \in E} \|x_0 - T^k z\| \leq \text{diam } (S).\]

Now \(S'\) is a nonempty closed convex fuzzy bounded subset of \(K\) for which \(T(S') \subset S'\), \(S'\) belongs to the family \(G\) and it satisfy that \(S' \subset S\) and \(S' \neq S\), which this contradicts the minimality of the set \(S\), so the set \(S'\) has only one point and it is fixed point of mapping \(T\). By this the proof of Theorem 4.2 is completed.

\[\square\]

Theorem 4.3. Let us introduce the mapping \(T: K \to K\) where \(K\) is a nonempty closed convex fuzzy bounded subset of the fuzzy reflexive space \(X\) and let \(K\) have the
property $FNSTN$, where $T$ is one of the mappings that is defined in the property $FNSTN$.

If for any closed and convex subset $E \subset K$ with more than one element it satisfies that $T(E) \subset E$ and

$$\| Tx - Ty \| \leq \sup_{k \in \mathbb{N}} \| x - T^k x \|, \quad (3)$$

for all $x, y \in E$, then the mapping $T$ has the fixed point.

**Proof.** In the same way as in Theorem 4.2, we come to the set $S$. If the set $S$ has one element, with regard to $TS \subset S$, it is also the fixed point of mapping $T$.

Let us presume that the set $S$ has more than one element. On the basis of the property $FNSTN$ and the condition (3) for $x = x_0$, we get that

$$\| Tx_0 - Ty \| \leq \sup_{k \in \mathbb{N}} \| x_0 - T^k x_0 \|,$$

for all $y \in S$.

By the similar reasoning, as in the Theorem 4.2, we come to the relation

$$\| Tx_0 - y \| \leq \sup_{k \in \mathbb{N}} \| x_0 - T^k x_0 \|,$$

for all $y \in S$.

Let us form the set

$$S'' = \left\{ v \in S : \sup_{x \in S} \| v - z \| \leq \sup_{k \in \mathbb{N}} \| x_0 - T^k x \| \right\}.$$

The set $S''$ is nonempty. If $v \in S''$ let us prove that $Tv \not\in S''$. Since the set $S$ is a convex combination of elements from $T(S)$ for every $x \in S$ and $k \in \mathbb{N}$ the inequalities are valid. Since

$$\| Tv - z \|_v^v = \| Tv - \sum_{i=1}^n \alpha_i T z_i \|_v^v \leq \sum_{i=1}^n \alpha_i \|Tv - T z_i \|_v^v \leq \sum_{i=1}^n \alpha_i \sup_{k \in \mathbb{N}} \|v - T^k v \|_v^v \leq \sup_{x \in S} \| v - x \|_v^v \leq \sup_{k \in \mathbb{N}} \| x_0 - T^k x_0 \|_v^v,$$

i.e., we have

$$\| Tv - z \| \leq \sup_{k \in \mathbb{N}} \| x_0 - T^k x_0 \|,$$

thus $T(S'') \subset S''$.

It is simple to prove that the set $S''$ is closed and convex. On the basis of the definition of the set $S''$ for all $v, w \in S''$, we have that

$$\| v - z \| = \sup_{y \in S''} \| v - y \| \leq \sup_{y \in S''} \| v - z \| \leq \sup_{k \in \mathbb{N}} \| x_0 - T^k z \| \leq \text{diam}(S).$$

Now $S''$ is a nonempty closed convex fuzzy bounded subset of $S$ and it satisfy that $S'' \neq S$, which is impossible because of the minimality of the set $S$. This completes the proof of Theorem 4.3.

**5. CONCLUSION**

One of the most important topics of fixed point theory is fixed point results in fuzzy analysis, because of that, we see in [15] the spectrum of the class of fuzzy normed spaces is broader than the class of normed spaces. By means of introduction of the notions of $FNSTN$, $FNSTN$ we prove the theorems of the fixed points of some classes of mappings on the sets from the fuzzy reflexive space, which have some of the properties $FNSTN$, $FNSTN$.
